What is Natural Gas

- Natural gas is a fossil fuel formed when layers of buried plants, gases, and animals are exposed to intense heat and pressure over thousands of years
- ■The energy that the plants originally obtained from the sun is stored in the form of chemical bonds in natural gas

General Energy Terminology

Gas

Oil

Coal

BTU

Gallons

Tons

MCF

Barrel

Therm

■ Gallons (Propane)

ESC

© Energy Solutions Center Inc.

Terms: Natural Gas Units of Measure

Natural Gas

A domestic product that is mostly methane, CH₄

Cl

1 Cubic Foot of Natural Gas, Usage Component

CFH

Cubic Feet per Hour, Demand Component

- CCF

100 Cubic Feet of Natural Gas

MCF

1,000 Cubic Feet of Natural Gas

■ BTU

British Thermal Unit

Tip
The Natural Gas
industry uses Roman
Numerals.
C = 100
M = 1,000

Terms: Natural Gas Units of Measure

MBH

1,000 BTU per Hour

Typically Natural Gas is sold in CCF, MCF, Therm or DTH

Therm

100,000 BTU's

DTh

Deca Therm 1,000,000 BTU's

LDC

Local Distribution Company or gas utility

w.c

Pressure in inches of water column (27.68 Inch w.c. = 1 PSI)

PS

Pounds Per Square Inch

10

© Energy Solutions Center Inc.

Terms: Natural Gas Distribution

Henry Hub

 Central location where natural gas from the Well Heads is managed, sold, and re-distributed to the LDC's

City Gate

 Location point where the transmission lines end, and the local utility gas mains begin

Basis

 Differential pipeline costs associated with various entry points along the transcontinental pipeline.
 Often used to describe the pipeline transportation cost to City Gate including differential costs.

<u>his Photo</u> by Unknown Author is licensed under <u>CC BY-SA-NC</u>

11

Terms: Natural Gas Purchasing

- **1,037 BTU/CF (per EIA for 2021)**
 - The heating value fluctuates daily and varies differently at different gate stations across varying regions
 - The gas industry buys gas in BTUs and sells in volume

NYMEX

New York Mercantile Exchange is the place where futures contracts for natural gas are traded daily

Contract

■ 10,000 Deca Therms of Natural Gas

Transportation Charges

■ Typical charge to transport gas from the city gate to the end user or 'Burner Tip'

12

© Energy Solutions Center Inc.

Terms: Natural Gas Transportation

■Bundled Service

The LDC buys, pays basis and transports the gas to the end user for a bundled cost

Un-Bundled Service

The end user buys their own gas and pays all cost to have it delivered to the City Gate, and pays the LDC only for transportation service from city gate to their facility

13

Miscellaneous Terms / Definitions

BTU

- The most common denominator in energy
- One British Thermal Unit is the amount of energy required to raise 1 pound of water by 1
 Degree Fahrenheit at base pressure and temperature conditions

Horsepower

- Horsepower can be a relationship to boiler heating output capability or brake horsepower in an electric motor
- 1 Boiler Horsepower is equal to 33,472 BTU's of output energy off of the boiler

CHP

■ Combined Heat and Power, also known as Co-Generation

14

© Energy Solutions Center Inc.

Miscellaneous Terms / Definitions

HVAC

Heating, Ventilating, and Air Conditioning

Cooling Ton

- The equivalent of melting one ton of ice over 24 hours
- The term originated during the transition from stored natural ice to mechanical refrigeration
- One ton = 12,000 BTU's

Life Cycle Costing

a way to view two different options where the total costs for each option are reviewed side by side over the expected life of the equipment (typically 20 years). Included in the analysis are: Capital Costs (including interest rates), Energy Costs (including inflation factors) and Maintenance Costs expected for each option

15

Factors that Impact the Number of BTUs in a CF of Gas

Pressure

 Natural gas is very compressible, More gas can be fit in the same cubic foot of space by a pressure factor =~ (gas pressure + 14.73 atmospheric pressure) / 14.73

■ Temperature

Natural Gas also compresses with colder temperatures, but minimally

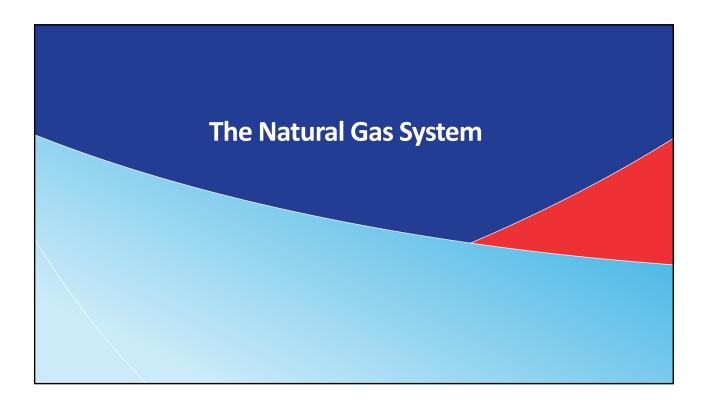

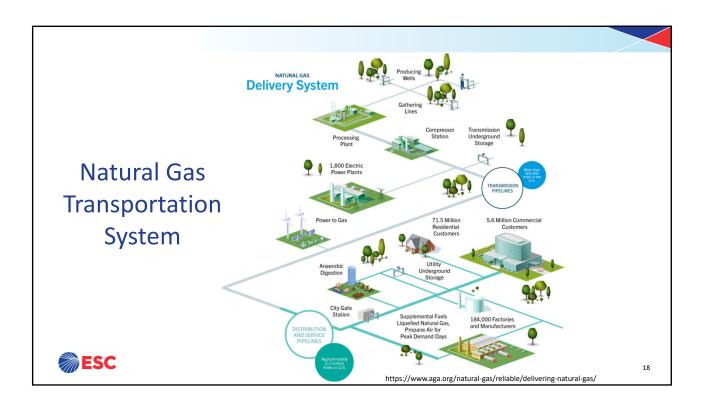

16

Other Energy Sources

Crude Oil

- America is extremely dependent on Foreign Crude Oil
- Refineries in America separate 'Crack' the crude into many more usable fuels:
 - The lightest fuels derived are gaseous ethane & methane
 - Next Propane and Gasoline in liquid form
 - A number of different grades of oil are then derived from Kerosene the lightest then #2 oil (Diesel) through #6 oil which is the heaviest oil
 - Lastly comes a product called coke which is either cracked further or used as a solid form of fuel similar to coal

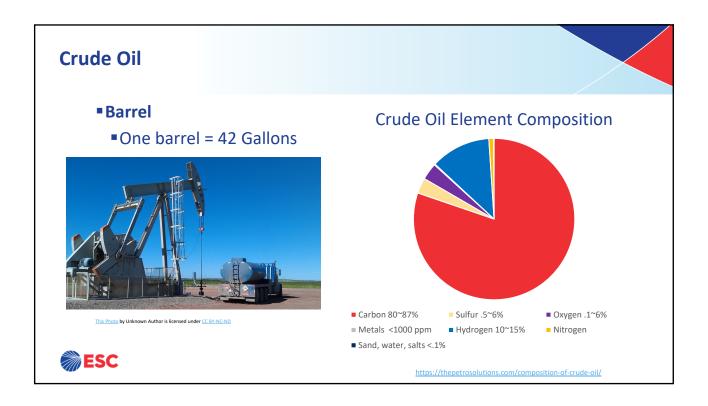

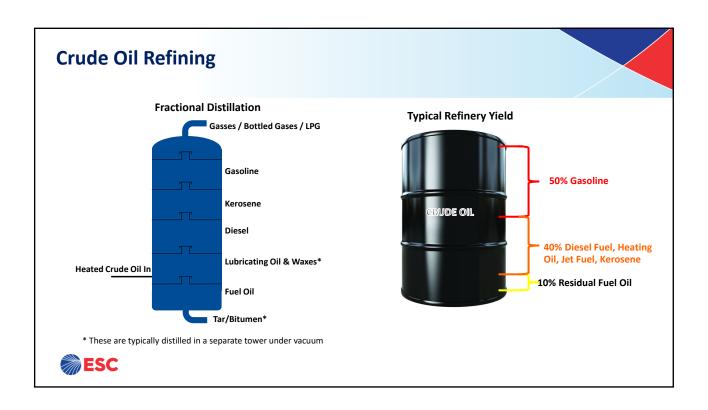

22

© Energy Solutions Center Inc.

Oil Grades

•Grades: #2, #4, #5, or #6

- #2 Oil (Heating Oil)
 - The lightest oil used for residential, commercial and light industrial
 - Most popular grade used in Boilers predominately
 - Used in commercial market sector, retail, offices, etc.
- #6 Oil

- The heaviest and thickest oil typically industrial fuel
- Less expensive than #2 oil has higher BTU content
- Requires that it be kept hot during storage and additional heating before burning
- Used in larger boilers or industrial applications, hospitals, etc.

- Diesel
 - Used to power diesel engines
 - Same characteristics as #2 oil (difference being taxation of the different fuels and #2 oil is dyed a different color for government monitoring)
 - Used for back up generators and transportation fuel

25

Where is Heating Oil Being Used? 5.2 Million homes heated with oil during 2020/2021 heating Season (Was 8.6 Million in 2008) Top 5 states using heating oil:

© Energy Solutions Center Inc.

Oil Operating & Maintenance Costs

- There are significant O&M cost associated with burning oil in comparison to natural gas:
 - Approximately 2.8% of cost for #2 oil
 - Approximately 6.6% of cost for #6 oil
- Efficiencies degrade when burning oil as soot builds up in boilers versus fairly constant efficiency with natural gas

This Photo by Unknown Author is licensed under CC BY-SA

Assumed Oil Operating Costs

Loss From	Description	#2 Oil	#6 Oil
Oil Pumping	Cost of electric required to pump oil from tank to boiler.	.32 %	.32%
Oil Inventory	Oil is paid for and stored before use compared to being billed after use	.6%	.6%
Atomization	The cost to atomize oil into small droplets & mix with combustion air	1.88%	1.88%
Oil Pre-Heating	Heating oil to 200 – 250 deg F so that it may be atomized		.78%
Storage Heating	Cost to heat and keep heavier grades of oil at 125 Deg F or more		2.0%
Make up Water	Water used for storage heating, soot blowing, etc.		.22%
Oil Additives	Additives to the heavier oils to boilers operate properly		.8%
	Total	2.8%	6.6%

Data taken from "An Analysis of the Losses and Costs Associated with Oil Versus natural gas Firing, an Update on a Nationwide Boiler program", 6/18/90

© Energy Solutions Center Inc.

Propane

- Propane is stored in liquid form, but burned in a gaseous form and has similar characteristics to that of Natural Gas when burned
- ■L.P.
 - Liquid Propane, One of the many byproducts that results in the cracking process of crude oil to turn it into Gasoline
- Gallon
 - Unit of measure that Propane is sold at
- Propane is often used when natural gas is not available
- Air Blending
 - A process where air is blended with propane
 - to give the characteristics of natural gas

29

Coal

- Anthracite contains 86-98% carbon, and has a heating value of about 15,000 BTUs/lb.
- Bituminous Coal contains 45-86% carbon and is the most abundant form found in the U.S. although sulfur content tends to be high. Heating value: 15,500 BTUs/lb.
- Subbituminous Coal contains 35 to 45% carbon with a heating value of 8,300 –
 13,000 BTUs/lb
- Lignite Coal contains 25-35% carbon, is generally high in ash and has a heating value of 4,000 8,300 BTUs/lb

Coal CO₂ Emissions are Twice that of Natural Gas

30

© Energy Solutions Center Inc.

Coal Facts

- In the US, ~92 %* of the ~ 501 million short tons of coal consumed in 2021 was used for electricity generation
- Coal is environmentally challenged in terms of CO2, sulfur, mercury, particulates, and coal ash discharges
- 1 Short Ton = 2,000 Pounds
- 1 Tonne (metric ton) = 2205 pounds

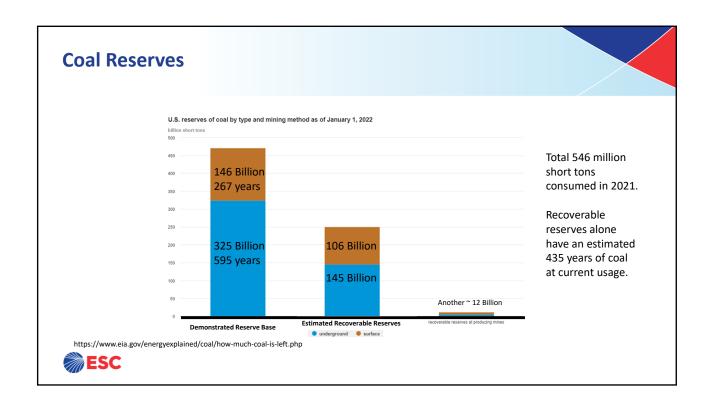

* EIA, https://www.eia.gov/coal/data.php#consumption, Table 26

Six states had 77% of the *demonstrated reserve base* (DRB) of coal as of January 1, 2022:

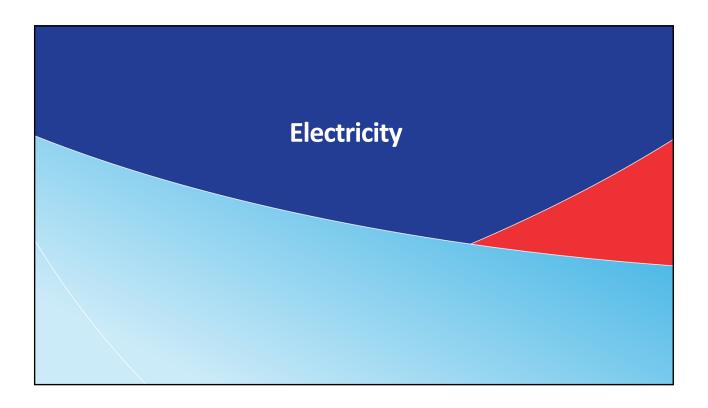

- •Montana—25%
- •Illinois—22%
- •Wyoming—12%
- West Virginia—6%Kentucky—6%
- •Pennsylvania—5%
- Twenty five other states had the remaining 23% of the DRB.

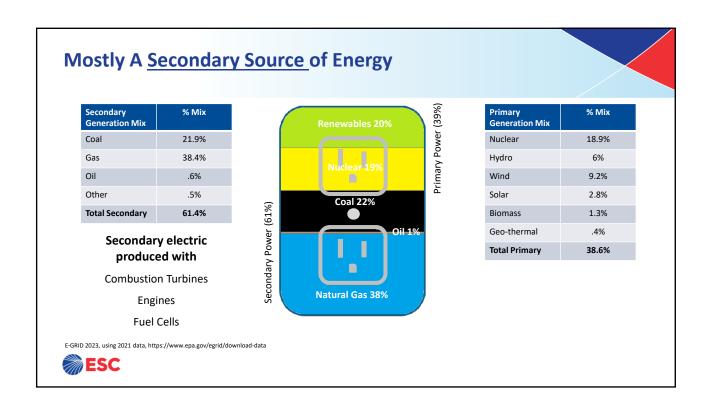

https://www.eia.gov/energyexplained/coal/how-much-coal-is-left.php

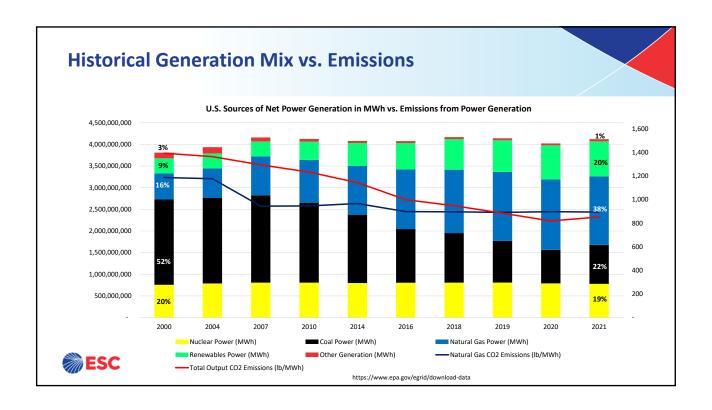

© Energy Solutions Center Inc.

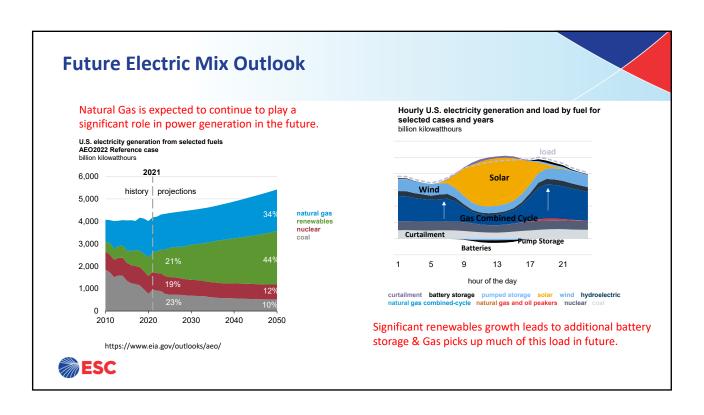

Electric Factors

- •kW Kilo Watt, 1,000 Watts, Demand Component
 - 1 kW is equivalent to 3,412 BTUs
- kWh Kilo Watt Hour, Usage Component
- ■MW Mega Watts, 1,000,000 Watts
- Peak Time of day when electric usage is at highest level, hours determined by local electric utility
- Load Factor Relationship of one's usage to their demand
- Power Factor calculation related to 'spikes' caused by end user motors etc. These may require a tremendous draw until up to speed, and the cure is typically to add capacitors

37

Terms: Electric Generation

- Spark Spread
 - The difference between the price of power & the cost to produce it at a given facility
- Simple Cycle
 - One pass generation, where waste heat is not recovered to generate additional power
- Combined Cycle
 - Producing additional electricity from otherwise lost waste heat exiting from gas turbines. This process increases the total efficiency.
- Capacity the maximum load that a generating station can carry under specific conditions for a given period of time

38

© Energy Solutions Center Inc.

ESC

Synchronous / Parallel Generated power must synchronize with the grid power if the customer wants to work in tandem with grid power RRP Real Time Pricing - Buying electric on hourly basis the day before it is expected to be used

Misc. Electric Terms ■ ISO - Independent System Operator ■ Coordinates, controls and monitors the operation of the electric power system ■ RTO - Regional Transmission Organization ■ Local grid who controls all power flow for a given region ■ Stranded Costs ■ Those costs prior to de-regulation that may not be able to be recovered after de-regulation ■ CTC ■ Competitive Transition Charges, way to recover of stranded costs ■ ESC

© Energy Solutions Center Inc.

Terms: Buying Deregulated Electric

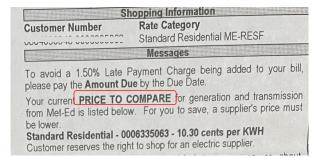

- EGS Energy Generation Supplier
 - where to buy de-regulated power
- Price to Compare
 - Utility price for energy and capacity if customer decided to remain with Utility what is shopped against
- Default Provider of Last Resort
 - Local electric utility will supply power if customer does not wish to participated in de-regulated electric or is dropped by their EGS

41

Terms: De-regulated Electric Bill Components

- Energy and Capacity
 - Charge for generated electric
 - This is the piece that is bought separately from the utility in the deregulated market
- T&D
 - Transmission and Distribution
- Variable Distribution Charges
 - Cost to deliver power to end user

42

© Energy Solutions Center Inc.

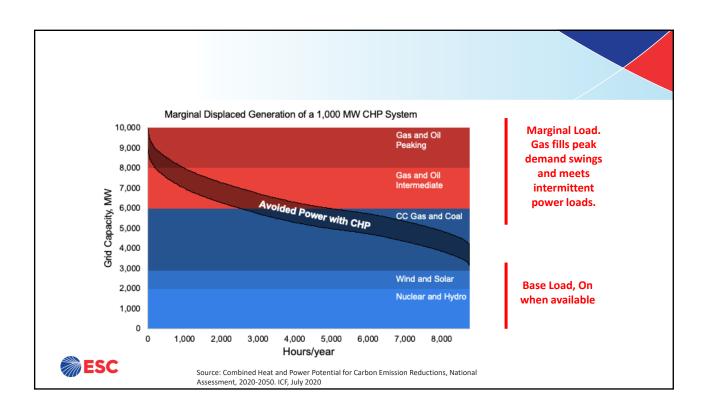

Generation Pros & Cons

	Pro	Con
Nuclear	No site Greenhouse gas emissionsDomestic Fuel supply	Radioactive wasteUranium miningTransportation
Coal	Domestic supply	Highest greenhouse gas emissionsCoal mining
Wind	No emissionsNo fuel or water consumed	Intermittent supplyCan be far from customers
Natural Gas	 Least land required, mostly domestic supply 	Greenhouse gas emissionsDrilling

43

Heating Values/BTUs

Oil Factors

- Heating oil BTU values vary by quality & grade of fuel
- •Oil today likely has less BTU's per gallon than years ago primarily due to additives and government requirements of lower sulfur/gallon
 - Distillate Fuel (#2 oil) = 5.817 MMBtu per barrel = 138,500 BTU/Gallon
 - Residual Fuel (#6 oil) = 6.287 MMBtu per barrel = 149,690 BTU/Gallon
- Natural Gas averages 1,037 BTU/Cubic Foot

46

© Energy Solutions Center Inc.

Gas Factors

- ■1 Gallon Propane = 91,600 BTU's on average
- ■1 Pound Propane = 21,500 BTU

■ Natural Gas = 1,037,000 BTU/MCF

Coal Factors

- ■1 Ton Coal (Anthracite) = 27,000,000 BTU
- ■1 Ton Coal (Bituminous) = 26,000,000 BTU

This Photo by Unknown Author is licensed under CC BY-N

48

© Energy Solutions Center Inc.

Electric Factors

- **■1 KWH** = 3,412 BTU
- Monthly Load Factor =

{Total Usage kWh / Registered Demand kW} {#days/month X 24hrs/day}

- **■1 kW** = 1.341 horsepower
- ■1 Horsepower-hour = 2,545 BTU
- ■To generate 1 kilowatt-hour (kWh) requires 10,000 BTU of fuel burned by the average electric utility

his Photo by Unknown Author is licensed under CC BY-SA

49

Converting Gas to \$ Equivalent

- Natural Gas to #2 Oil
 - * \$/MCF Gas X 138,500 BTU/Gal#2 1,037,000 BTU/MCF = \$/Gallon equivalent
 - #2 Oil = 7.41 gallon per MCF
- Natural Gas to #6 Oil
 - * \$/MCF Gas X 149,690 BTU/Gal#6 = \$/Gallon equivalent
 - #6 Oil = 6.86 gallon per MCF
- Propane
 - * \$/MCF Gas X 91,700 BTU/Gal LP 1,037,000 BTU/MCF = \$/Gallon equivalent

Energy Storage

■ Oil/Propane

 Typically stored by dealers in large tank farms, and smaller quantities are stored locally at the customer facility

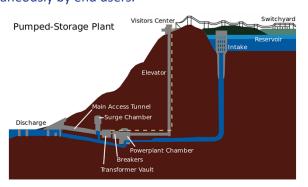

These Photos by Unknown Authors are licensed under CC BY-SA

Energy Storage

• Electric Storage

- Grid generated power must be used instantaneously by end users.
- Some storage methods include
 - Batteries
 - Pump Storage
 - Gas Generator

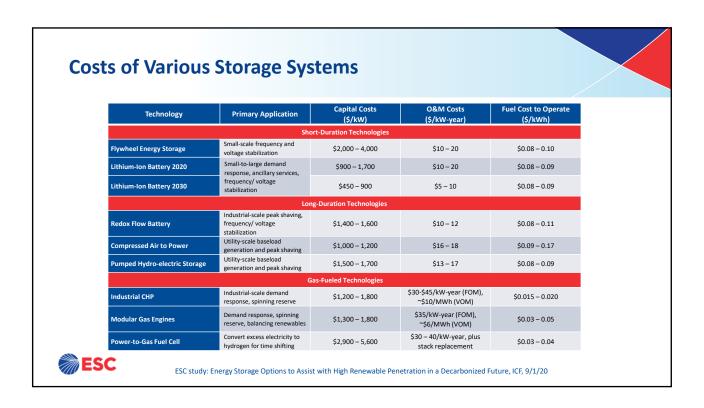

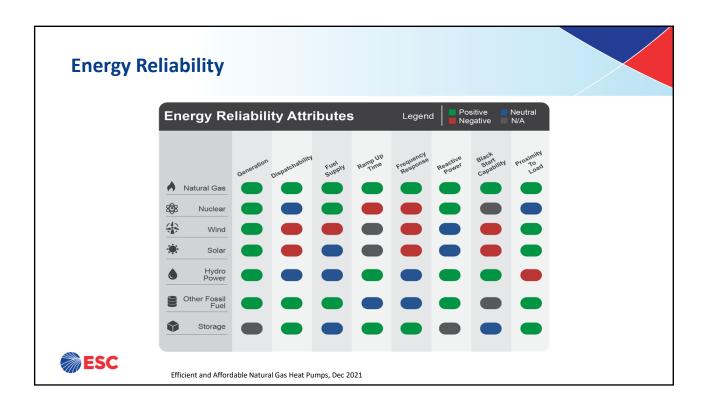

These Photos by Unknown Authors are licensed under CC BY

© Energy Solutions Center Inc.

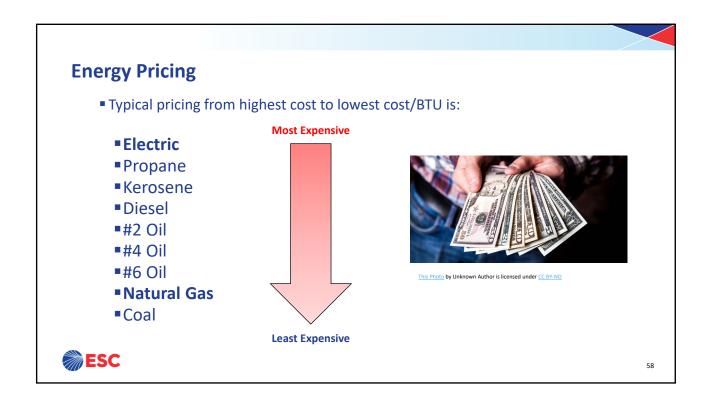

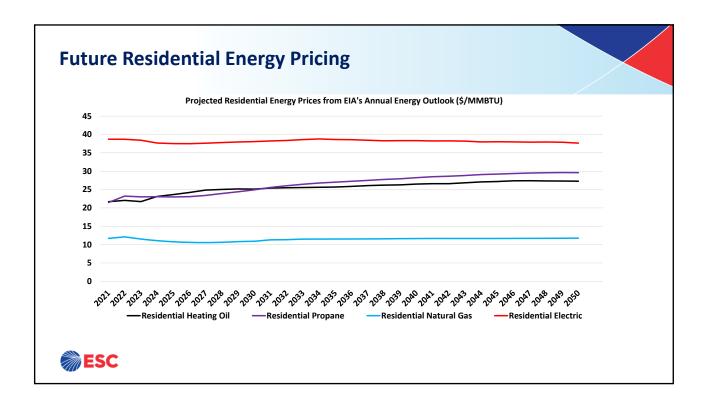

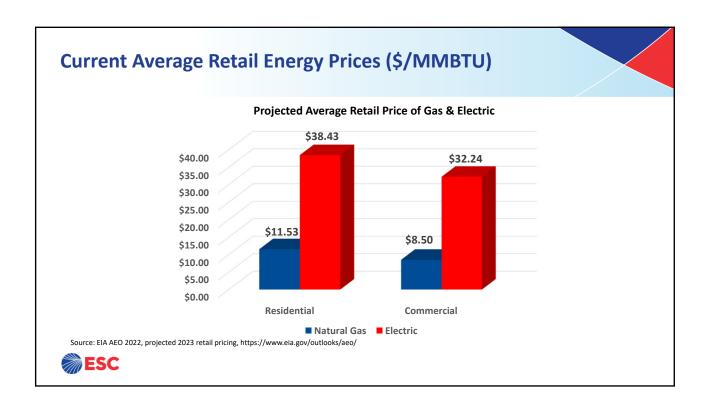

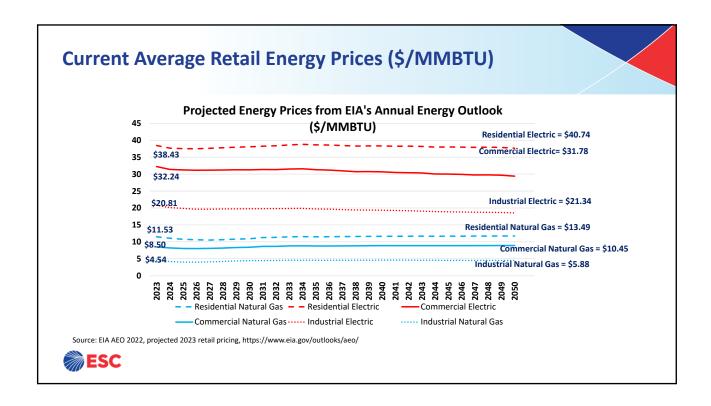

Typical Efficiency

Efficiency

The related energy output or effect as a result of energy input

Heating

- With Natural Gas, Oil or Propane the standard efficiency today is around 80-82%
- Higher efficiency models are also available > 90 %
- Gas Heat Pumps are approx. 140% efficient

■Electric Resistance Heating or Gas Infra Red

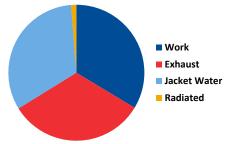

- There is no energy lost in the form of waste heat and is typically 99% efficient
- **Electric Heat pumps** work differently and have efficiencies well over 100%. Electric heat pumps are typically rated in Heating Seasonal Performance Factors (HSPF)

Engines

 Natural Gas & Diesel engines are typically only around 30% efficient, but have tremendous amounts of waste heat which can be re-captured and utilized

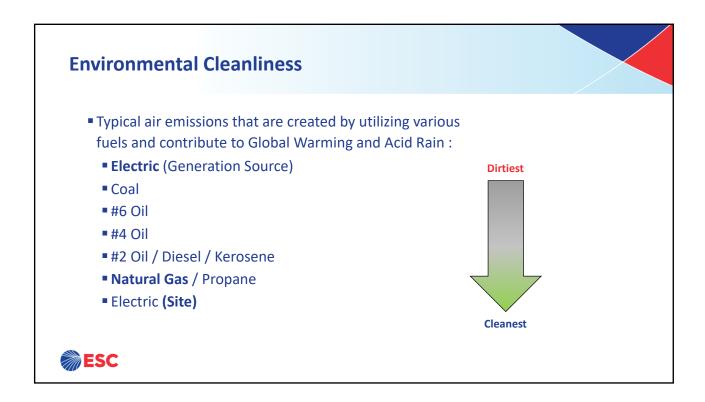

© Energy Solutions Center Inc.

Carbon Dioxide Emissions From Combustion of Fossil Fuels

Carbon dioxide emitted per quantity of energy for various fuels

Fuel Type	CO ₂ Emitted (lbs/10 ⁶ Btu)	CO ₂ Emitted (kg/10 ⁶ Btu)
Natural Gas	117.00	53.07
Propane	139.05	63.07
Automobile Gasoline	157.20	71.30
Kerosene	159.40	72.30
Fuel Oil	161.30	73.16
Coal (bituminous)	205.70	93.30

EIA CO2 Emissions Coefficients

Other Fossil Fuel Emissions

	Pounds per Billion Btu's of Energy Input			
Pollutant	Natural Gas	Oil	Coal	
Carbon Dioxide	117,000	161,300*	205,700*	
Carbon Monoxide	40	33	208	
Nitrogen Oxides	82	448	457	
Sulfur Dioxide	1	1,122	2,591	
Particulates	7	84	2,744	
Mercury	0.000	0.007	0.016	

The amount of ${\rm CO_2}$ produced far exceeds any other harmful pollutant Natural Gas has much lower emissions of greenhouse gases than oil or coal
